

L'Hôpital's rule

Theory	Clever application
<p style="text-align: center;">Motivating special case</p> <p>Example: Each of functions f and g has the following properties:</p> <ul style="list-style-type: none"> • Twice differentiable • Root at $x = a$ • Equal to local linearization at $x = a$ $f(x) = \overbrace{f(a)}^0 + f'(a)(x - a)$ $g(x) = \overbrace{g(a)}^0 + g'(a)(x - a)$ $\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \lim_{x \rightarrow a} \frac{f'(a)(x - a)}{g'(a)(x - a)} \stackrel{\text{D.S.}}{=} \frac{0}{0}$ $= \lim_{x \rightarrow a} \frac{f'(a)}{g'(a)} = \frac{f'(a)}{g'(a)} = \frac{\lim_{x \rightarrow a} f'(x)}{\lim_{x \rightarrow a} g'(x)}$	<p style="text-align: center;">Product to quotient</p> $\lim_{x \rightarrow 0^+} x \ln x = \lim_{x \rightarrow 0^+} \frac{\ln x}{1/x} \stackrel{\text{D.S.}}{=} \frac{-\infty}{+\infty}$ $\lim_{x \rightarrow 0^+} \frac{\ln x}{1/x} \stackrel{\text{L'H}}{=} \lim_{x \rightarrow 0^+} \frac{(\ln x)'}{(1/x)'} = \lim_{x \rightarrow 0^+} \frac{1/x}{-1/x^2} = \lim_{x \rightarrow 0^+} -x \stackrel{\text{D.S.}}{=} 0$ <p>Therefore,</p> $\lim_{x \rightarrow 0^+} x \ln x = 0$
<p style="text-align: center;">Steps</p> <ol style="list-style-type: none"> Write the given limit $\lim_{x \rightarrow a} \frac{f(x)}{g(x)}$ Determine whether direct substitution (or "direct substitution" for limits "at" $\pm\infty$) yields a value for the limit. <ol style="list-style-type: none"> If yes (e.g. when taking limit of continuous function at a value of x), stop. If, instead, one of the indeterminate forms $0/0$, $\pm\infty/\pm\infty$, or $\pm\infty/\mp\infty$ results, go on to step 3. Try to find a value for $\lim_{x \rightarrow a} \frac{f'(x)}{g'(x)}$ If a value for the limit in step 3 exists, then it is also the value of the limit in step 1. 	<p style="text-align: center;">Power to quotient</p> $\lim_{x \rightarrow \infty} x^{\frac{1}{x}} \stackrel{\text{"D.S."}}{=} \infty^0$ $\lim_{x \rightarrow \infty} x^{\frac{1}{x}} = \lim_{x \rightarrow \infty} \exp\left(\ln x^{\frac{1}{x}}\right) \stackrel{\text{COMP}}{=} \exp\left(\lim_{x \rightarrow \infty} \ln x^{\frac{1}{x}}\right)$ $\lim_{x \rightarrow \infty} \ln x^{\frac{1}{x}} = \lim_{x \rightarrow \infty} \frac{1}{x} \ln x = \lim_{x \rightarrow \infty} \frac{\ln x}{x} \stackrel{\text{"D.S."}}{=} \frac{+\infty}{+\infty}$ $\lim_{x \rightarrow \infty} \frac{\ln x}{x} \stackrel{\text{L'H}}{=} \lim_{x \rightarrow \infty} \frac{(\ln x)'}{(x)'} = \lim_{x \rightarrow \infty} \frac{1/x}{1} \stackrel{\text{"D.S."}}{=} 0$ <p>Therefore,</p> $\lim_{x \rightarrow \infty} \ln x^{\frac{1}{x}} = 0$ <p>Therefore,</p> $\exp\left(\lim_{x \rightarrow \infty} \ln x^{\frac{1}{x}}\right) = \exp(0) = 1$ $\lim_{x \rightarrow \infty} x^{\frac{1}{x}} = 1$
