

Rolle's theorem

Hypotheses

- $f(b) = f(a)$
- f is continuous on $[a, b]$
- f is differentiable on (a, b)

Conclusion

There is at least one value of c on (a, b) for which

$$f'(c) = 0$$

Mean value theorem

Hypotheses

- f is continuous on $[a, b]$
- f is differentiable on (a, b)

Conclusion

There is at least one value of c on (a, b) for which

$$f'(c) = \frac{f(b) - f(a)}{b - a}$$
